

Belize's Preparation of GHG Inventory for FOLU Sector

OUTLINE

- Belize Context
- Processes
 - Activity Data
 - Emission Factor
- Analysis of Results
 - Greenhouse Gas Inventory
- Key Insights

- 8,867 mi² (22,151 km²)
- Natural Resource-Based Economy (agriculture and tourism)
- Population: 400,000 (2020 est)
- Growth rate: 2.3%
- English speaking

- 36% terrestrial area protected
- Main driver of Forest Loss:
 - Agriculture Expansion
 - Infrastructure Expansion
 - Unsustainable and Illegal Logging
 - Hurricanes, Pests and Wildfires

BELIZE CONTEXT

Methodological Approach

ACTIVITY DATA COLLECTION

EMISSION FACTOR COLLECTION

Belize Activity Data Collection

PREPARATION

IMPLEMENTATION

VALIDATION

PREPARATION PHASE

1) LUA App Evolution

2) Expert Consultation

3) Ground truthing

4) Resource Allocation:

- Personnel selection for diverse expertise.
- Equipment provision for effective data collection.
- Logistic arrangement for centralized data collection hub

5) Training Program: Conducted a one-week training covering:

- Tool usage for efficient data collection.
- Remote sensing techniques for accurate interpretation.

Plot size is 0.5 ha
49 points within each plot
Each point represents 2%

Implementation

- 23,092 sample plots were randomly distributed among the core team
- Ground truthing activities during LULUC
- Quality control done weekly during assessment

Land Use Assessment App

PLOT ANALYSIS WITH
SUPPORT IMAGES

STEP 1

Zoom out to understand the context and location of the plot.

STEP 2

Export the plot to Google Earth Pro to determine land-use, using high-resolution imagery.

STEP 3

Open the auxiliary files in KML format to obtain additional information about the plot.

STEP 4

Open the *LandtrendR* tool to assess any past disturbances and the year of occurrence.

STEP 5

Open Google Earth Engine to analyze land use from the year 2000 onwards.

STEP 6

Assess Landsat and Sentinel 2 images, for each year, by exploring the high points in the NDVI graphs.

STEP 7

Fill out the survey with the information on land-use and land-use change.

VALIDATION

- IDENTIFIED ERRONEOUSLY LABELED PLOT IN ARCGIS PRO BY CORE TEAM
- 5% EXTRA PLOTS SELECTED FOR QA/QC ASSIGNED TO 3 OPERATORS
- PLOTS LABELED NO-CONFIDENCE WERE IDENTIFIED AND RE-ASSESSED

Emission Factor

- Emission factor represents the relationship between the amount of greenhouse gases emitted and the activity or processes causing those emissions
- The permanent forest inventory has undergone a significant expansion, evolving from the initial 32 one-hectare permanent forest plots
- To a more extensive network of 61 permanent forest plots
- This expansion incorporates updated values derived from meticulous studies conducted on mangrove, pine, and secondary broadleaf forests moving us from tier 1 to tier 2 and 3
- In instances where country-specific values were absent, default values from the IPCC were applied

An aerial photograph showing a large fire burning through a dense forest. A thick plume of white and grey smoke rises from the fire, spreading across the sky. The fire line is visible as a bright orange and yellow border between the burning and unburned forest. The text "Greenhouse Gas Inventory" is overlaid in a white box in the center of the image.

Greenhouse Gas Inventory

Data processing (Estimation)

The Belize GHG inventory employed 2006 & 2019 IPCC guidelines with combination of default values and country-specific emission factors.

The inventory adhered to international standards and utilized IPCC methodology tiers 1, 2, and 3.

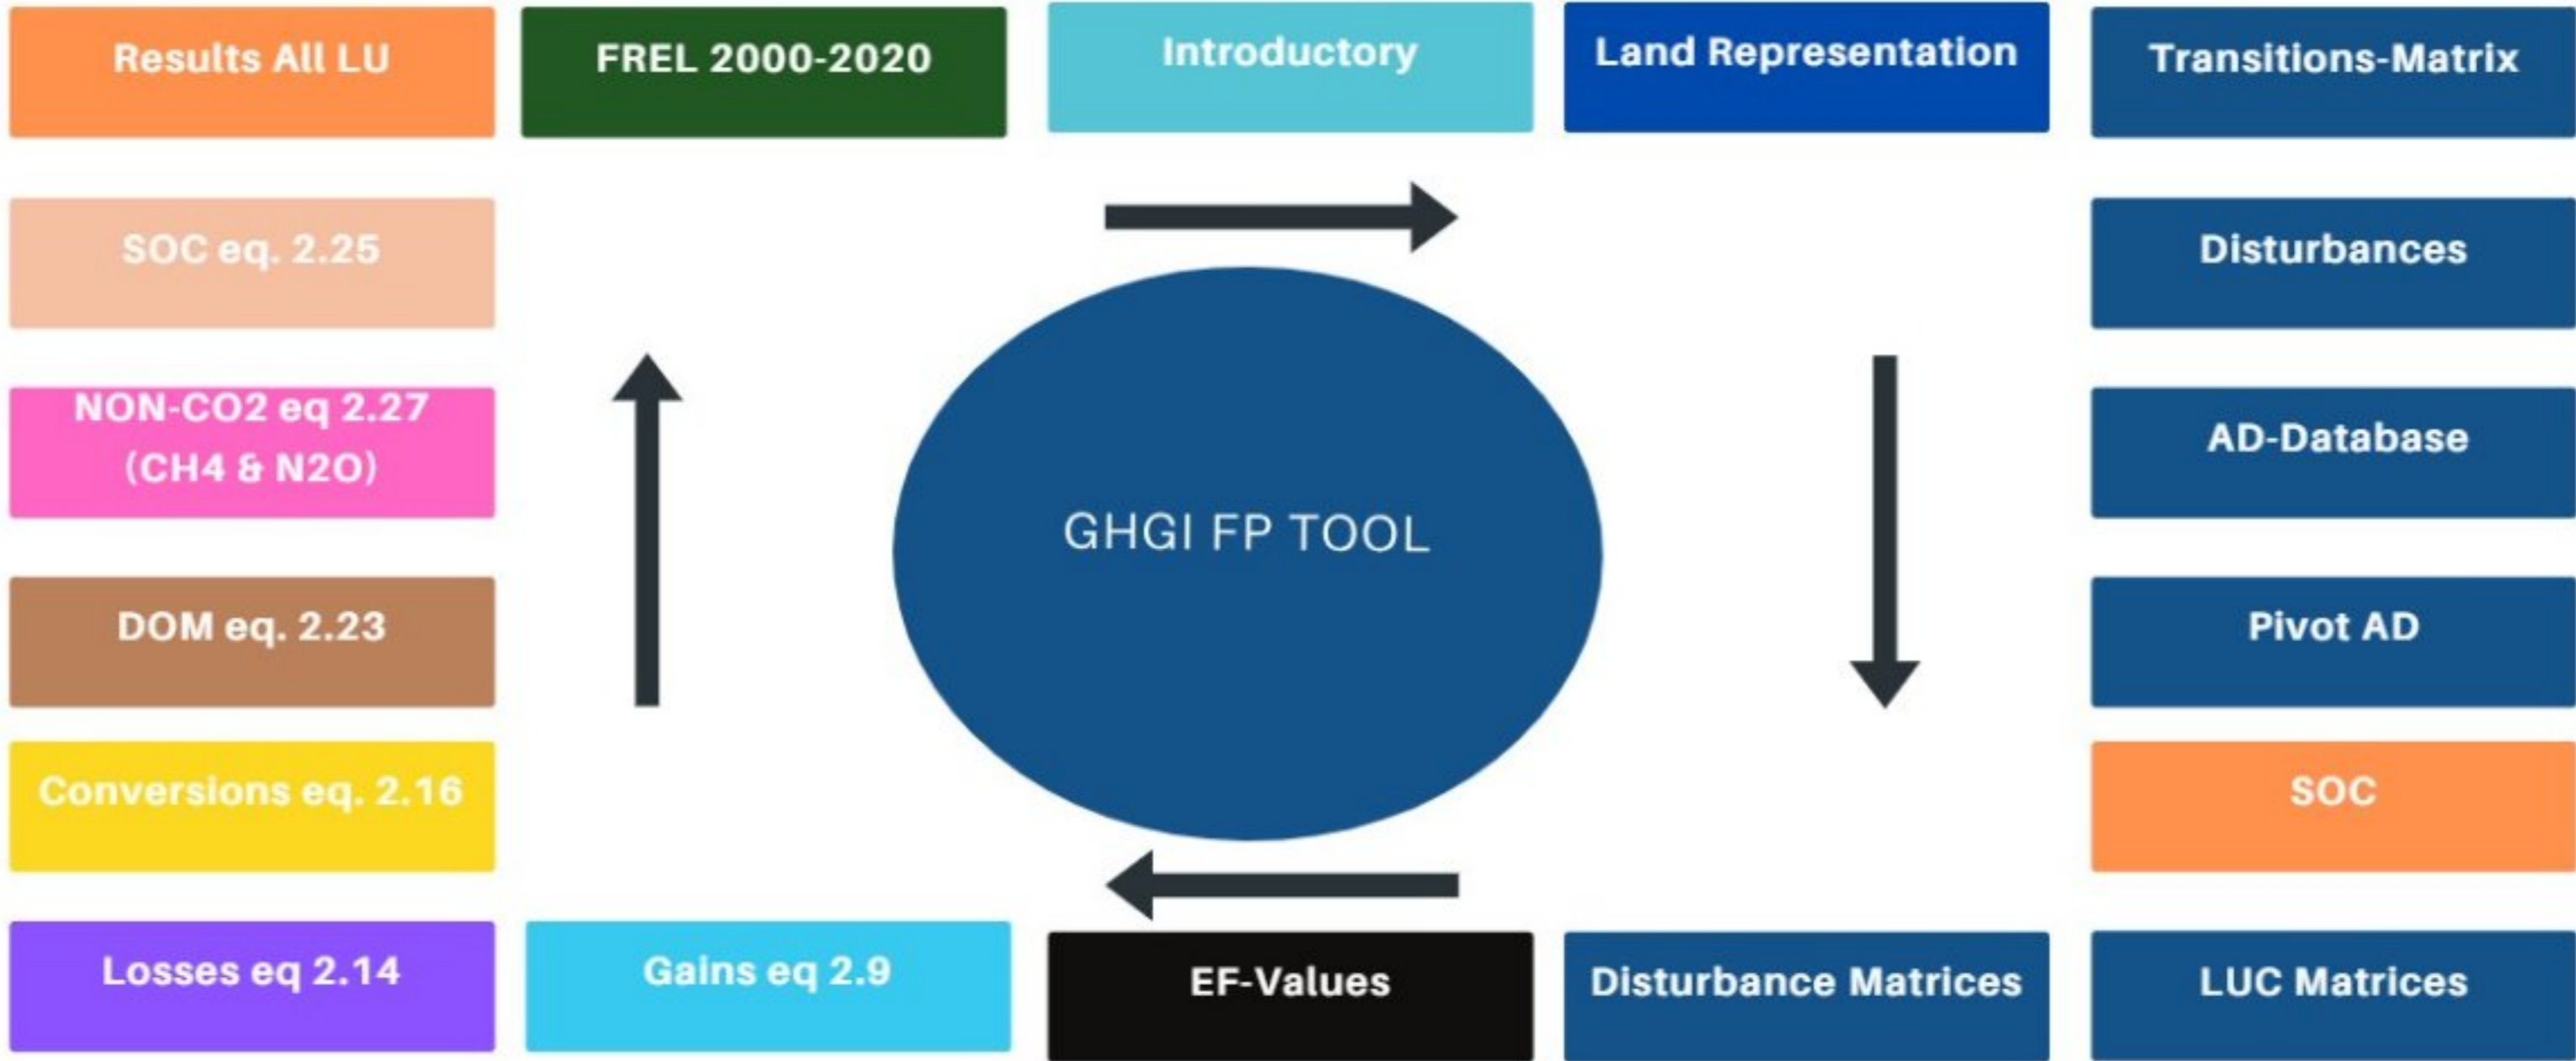

Land representation and the definitions of land use categories follows **the 2006/2019 IPCC guidelines**.

It includes the analysis for Land remaining in a land-use category and Land converted to a new land-use category.

Land Use, Land Use Change and Forestry Greenhouse gas (GHG) Inventory and REDD+ Reference Level and REDD+ Results

Estimation/Calculation Phase

IPCC equations were applied

Calculation on Gains, Losses, Conversions, DOM, Non-CO₂ (CH₄), Non-CO₂ (N₂O), SOC.

Calculations were done in three different section in each sheet:

1. Land remaining in the same category (Undisturbed)
2. Land Remaining in the same category (Disturbed)
3. Land Use Conversions

Gains eq. 2.9

Losses eq. 2.14

Conversions eq. 2.16

DOM eq. 2.23

NON CO₂ (CH₄) eq.2.27

NON CO₂ (N₂O.) eq.2.27

SOC eq. 2.25

2. Land Remaining in the same category (Disturbed)

Losses in forests that remain as forests were assessed due to various disturbances, both anthropogenic and natural.

Group 1

No expected regeneration:

Example: F/MBL/Dinfra_2005/DAgri_2015

Shifting Cultivation

Infrastructure/Other
Human Impact

Grazing

Mining

Group 2

Expected Regeneration:

Example: F/MBL/DHur_2010 or
F/MBL/DLog_2010

Hurricane

Logging

Fire

Expected Regeneration:

Pest

Expected Regeneration:

	4,122	2,714	0	201
	3,921	3,921	0	0
	3,110	0	0	0

Quality control:
Reviewing seven calculations sheets (Gain, Losses, Conversion, DOM, SOC, Non-CO₂-CH₄ & Non-CO₂-N₂O, Results) with 4,759 rows per sheet.

Three experts were part of the verification

Key Insights

A close-up photograph of a green plant with small, pointed leaves and a large yellow flower. A bee is flying near the flower, and another smaller flower is visible in the background.

- **Capacity Building - Continuous training and the enhancement of in country experts**
- **Leverage international support and cooperation**
- **Knowledge sharing**
- **Develop robust data collection system**
- **Follow guidelines**
